Han-Kwang USA announces the opening of its new 13,000 square-foot Chicago-area facility with showroom for laser machine demonstrations, as well as application engineering, parts and service departments. Typically, the new showroom will house multiple plate and tube cutting laser machines for customer use in test cuts and time studies, plus interested parties can see these powerful CO2 lasers in action, when considering a purchase or investigating laser technology for their shops and in-house fabrication processes.

In announcing this opening, Han-Kwang USA VP Robert Won commented, "This showroom is a further step in our company's long-term commitment to the North American market. We have worked hard over the recent years to develop our business, build relationships with our North American dealer network and especially support our customers with the latest technology and application assistance."

The parts department is fully stocked with all key consumable and mechanical components for the full range of Han-Kwang lasers currently in the field and offered by the company, including the new PS, PL and TL plate and tube cutters.
